

# Fire-Fighting safety—from every point of view

## The value of safety: a reliable partner - from every point of view!

In a universe undergoing continuous technological and organizational changes such as that of enterprise, FAS products are constantly monitored to meet its growing demands and expectations. Since its foundation in 1967, FAS (Fabbrica Apparecchiature Antincendio) has developed steadily with this perspective in mind, promoting innovation and enhancing the reliability and safety of its systems of fire prevention and extinction. As a result, our products' performance has reached a level of excellence which makes it possible to maintain competitive advantages within a framework of quality production. From the meticulous research of the project phase to the selection of materials, all the way through to the actual manufacture, each system is adapted to the specific sector of application, modifying the product, if necessary, to tailor the customer's needs. Our firefighting systems - whether fixed or mobile, employing foam, water or CO<sub>2</sub> - may be matched to those of fire prevention, including our equipment for the detection of smoke, gas, flame and hydrocarbon leakage. FAS's indefatigable commitment to safety is tangible in the quality of its production, the visible result of the company's research and investment programmes always keeping an attentive eye to the future.

## Innovation and resources - from every point of view!

FAS policy and strategy has centered its efforts on product innovation and quality, from research to the finished product. Technological evolution, in fact, has in no way slackened our team's output of ideas and intuitions but, on the contrary, empowered their realization. Careful observation of productive realities, sector analysis, follow-up of all production phases, examination of recurrent operational behavior and automatism, random events - all these typical elements of the theater of everyday company life are monitored constantly by FAS staff in order to avoid any possible negative developments. This practical knowledge and experience directly on the field are our starting point for the creation of personalized fire-fighting solutions which are particularly adequate for production areas. Safety methodology is our business: Specialized personnel and a wide range of quality products have launched FAS as a highly competitive firm onto the international scene, as its prestigious and worldwide customer portfolio clearly shows.

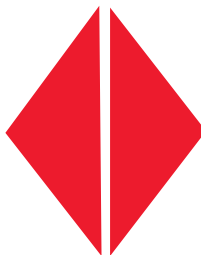

## The Customer: our main concern - from every point of view!

Our aim is an ambitious one: to offer our customers the founding elements of our entrepreneurial reality, namely, research and development, projects, production of tailored systems of fire prevention and extinction - a decades-old tradition in a company where customer satisfaction is a priority.

Dedication and attention starts right at the initial considerations and verifications of each individual case, up to the methodological applications of safety, chosen from among the wide range of possibilities available today. Dialogue with our customers is open and frank at every stage of the way: research, projection, verification, technologies involved, formative stages. In fact, our highly qualified personnel are at the customer's disposal at all times, should he desire explanations or changes of any kind during the manufacturing process. Italian and international norms (UNI - NFPA - UL/FM - ASME) are applied at all stages of production. The UNI EN ISO 9001 certification issued by Lloyd's Register and the U-STAMP issued by ASME, confirming the awareness and attention to the quality of the processes of the company. Open contractual relationships (both internal and external), decisional procedures, professional know-how and workmanship, specific competence and expertise solidified through years of experience, all contribute to FAS's unique heritage of values and social capital.
